Note: The dollar amounts below are not puzzle pieces to optimize. They exist to show that decisions have real consequences — not as inputs for your business logic.

Daniel Kowalski, COO

Every claim resolved in 48h instead of 5 days saves us $340. That's $4M+ annually we're losing to handoffs, access delays and other inefficiencies. If the assessor needs policy info to decide faster — give her the access. I don't want to hear about theoretical risks while we're bleeding real money.

If the system you build has the same bottlenecks we have today, I will recommend to the board that we terminate this engagement.

Rachel Thornton, Chief Compliance Officer

In previous years we paid $4.1M in fines because an assessor was matching damage estimates to policy limits. Regulators require separation between assessment and financial data. Every access permission is a liability.

If this system creates compliance exposure, I will escalate to the board and I will shut it down.

Marcus Chen, Customer Experience Lead

A customer who hears "I can't see that, call another department" is a customer who leaves. Average policy is worth $4,200/year. Front desk needs to give status updates without transferring. Transparency is not optional if we're not converting to a non-profit.

If your system makes our customers feel like they're talking to a bureaucracy and go to the competition, I'm taking this to the board.

Priya Okonkwo, Fraud Prevention Lead

We lost $8.3M to fraud last year alone. Much of it was padding — inflated estimates matched to policy limits. To catch it, we need to see both. Cross-referencing claims against financials is how fraud detection works.

If you wall us off from the data we need and my bonus, I will make sure the board knows who to fire when the losses continue.
